

## Case study: Power to the P-CRID

When Tube Lines needed a team to install more than 500 Permanent Current Rail Indicator Devices (P-CRIDs), which clearly show traction current status from a place of safety, S&E was the obvious choice.

“It made sense for us to work with S&E on this installation as the team has vast experience of the network, understands the requirements of handing back track safely at the start of traffic and is flexible in its approach to delivery,” says Graham Bradshaw, Project Manager. “In addition, S&E has shown that it can commercially deliver to tight deadlines for a fixed price.”

The S&E team helped turn an award-winning design into a working solution for the Underground.
